

Investment offer

Do you think of 2–3-year investment that brings back not 10 or 15 % but much more?

We think about that too.

We are looking for initial investment to receive great return in the nearest future.

What we offer? With all excitement related to the recent AI tools, like GPT-4, they are really just the tools. We offer the patented technology, platform and services to convert the AI tools into useful products to accelerate decision making and knowledge sharing in education and business via conversational AI.

Can you lose money on this investment? The usual answer is yes.

In our case it is almost impossible.

Why? Take a look just at the valuation of the Development Factory patent.

[2024-Patent-Valuation](#) | [Copilot-on-patent-claims](#) | [2025-Patent-Valuation](#)

We plan to sell it in about two years via the Patent Auction.

Why not now? Every month increases the profit obtained by Microsoft, Google, and more companies, based on the patented ideas and system. This means that the value of the patent is growing too. When the patent will be sold, we pay 25 % of the sold price to the inventor, and to 75% all other shareholders based on their percentage ownership of the patent sale price.

So, you will get a portion of the patent sales price.

The other reason is that we plan to develop real products for businesses and education to capitalize on implementation the Development Factory patent.

The value of the company and your ROI will grow.

The BASE platform allows us to integrate public data collected by multiple Large Language Models (LLM) with private corporate data that enterprise is not going to share with public.

Our platform includes conversational AI engine to use integrated knowledge base to improve business decision making. Similar development is conducted by Palantir Technologies.

But the market is huge! And our patent gives us the best protection for this work.

These are small demos: [Conversational Learning](#) | [Stock and Crypto Advising](#) | [Conversational Design](#) |

Think of the demos as a small shadow. By connecting AI and your data, we turn the shadows into real products that activate your passive data assets into Conversational Decision Support systems.
